Today, many people put their personal and private information online (address, phone number, and credit card number) to facilitate everyday activities, such as banking, shopping, and socializing. Is this a positive or negative development?

Follow as develop of technology, personal's details are more transparent. It has bring some benefits and also disadvantages. People are held with different opinions with that issues.From my perspective its benefits has overceed its disadvantages.

One the one hand, transparent information has bring some benefits to people in many aspects. The internet will follow the research history to recommend the commodity and contents people's are looking for. In addition, the record of informations may safe in the internet,that next time the account can register the account automatically . For instance, the delivery app will follow person's recent location to complete the transfer destination.Moreover, the government has a specific department, they can use these online information to monitor their residents in which can protect the safety of the country.

On the other hand,the leak of prosonal detail leads the increasingly number of fraud events.These fraud through online questionnaire or television as predators elicit little animals apart for their habitat.And the leak of phone number may result in phone calls of advertisment .In many movies there exists digital wars.In the reality its also happened, these hacker through their ability to make benefits for themselves.

In conclusion,for private and business the internet is not safed ,despite people are saying the private details is secreted and confidential.But it still can be monitored by someone else.For government,it can monitored anyone's motion to avoid emergency accidemnt and it can help to maintain the development of the country.
